

Project Report

Project Title : Fashion & Outfit Recommendation

Introduction

This project is a Fashion & Outfit Recommendation designed to streamline the process of selling clothing and accessories online. The idea is to create a centralized platform where users can browse fashion items, place orders, and securely complete payments through integrated gateways such as Cash on delivery or local mobile wallets.

The system is built around a structured database that manages core entities like users, items, orders, ratings, wishlist, and outfit requests. To enhance functionality, we've added an inventory module that tracks stock levels by warehouse location, clothing size, and available quantity. This ensures that product availability is always accurate and up to date.

By combining inventory management with payment integration, the project provides a complete workflow: customers can explore outfits, add them to their wishlist or cart, place an order, and the system automatically updates stock levels while recording payment details.

Ultimately, the project aims to deliver a scalable, secure, and user-friendly fashion retail solution that benefits both customers and administrators.

 CSE 370 PROJECT

Conclusion

The Fashion and Outfit Recommendation project provides a complete framework for managing online clothing retail operations. By designing a structured database that includes entities such as Users, Outfits, Inventory, Orders, Payments, Ratings, Wishlist, and Discount Points, the system ensures that both customer facing and administrative needs are addressed effectively.

The addition of an inventory module allows precise tracking of stock levels across different warehouse locations and sizes, ensuring that product availability is always accurate. The payment gateway integration enhances the shopping experience by enabling secure and reliable transactions, while features like wishlists, ratings, and preferences improve personalization and customer engagement.

This project demonstrates how database driven applications can streamline fashion retail processes, from browsing and ordering to payment and fulfillment. It establishes a solid foundation for scalability and future growth, with potential extensions such as recommendation systems, analytics dashboards, and mobile app integration.

In summary, the project successfully combines technical efficiency with user-centric design, creating a robust and practical solution for modern fashion e-commerce management.
